#### 30. SOME NOTES ON THE DISTRIBUTION, NATURE OF HOSTS AND SYMPTOMS OF A FLOWERING PARASITE, *MACROSOLEN COCHINCHINENSIS* (LOUR.) VAN TIEGH. IN WEST BENGAL

*Macrosolen cochinchinensis* (Lour.) Van Tiegh. (= *Loranthus cochinchinensis* Lour.) a flowering parasite under Loranthaceae parasitizes a large number of wild and economically important plants in different regions of West Bengal. The slow and steady destructive nature of the parasite causes gradual growth reduction, loss of vigour and timber quality of the hosts. The characteristic symptoms in the hosts are the swelling or formation of small burrs on the stems, which ultimately cause death of the surrounding tissues and later the branches. It has been

TABLE 1

Name of the Hosts	Family	Distribution of Hosts	Economic Importance	Type of Infection	Type of Host
1. <i>Acacia nilotica</i> (L.) Del. sub. sp. <i>indica</i> (Benth.) Brenan	Mimosaceae	Frequently distributed throughout the province Rarely available in most of the districts	Important for wood	S	R
2. <i>Acacia linearifolia</i> A. Cunn. ex Maiden & Blakely	"	Cultivated Commonly in all the districts	— Fruits Sacred plant. Important for fruit & wood	S M	R C
3. <i>Manilkara zapota</i> (L.) Vanroyen	Sapotaceae	Cultivated throughout the province	Fruit and for wood	M	C
4. <i>Aegle marmelos</i> Corr	Rutaceae	Planted in Indian Botanic Garden	—	S	R
5. <i>Artocarpus heterophyllus</i> Lamk.	Moraceae	Cultivated throughout the province	Cotton and wood	M	C
6. <i>Bischoffia javanica</i> Blume	Euphorbiaceae	Very common in the province	Medicinal	S	R
7. <i>Bombax ceiba</i> L.	Bombacaceae	Common in Central Bengal	Cotton and wood	M	C
8. <i>Carya arborea</i> Roxb.	Lecythidaceae	Cultivated throughout the province	Fruit	S	R
9. <i>Citrus grandis</i> Osbeck	Rutaceae	Planted for economic use and avenue tree throughout the province	Timber yielding	S	R
10. <i>Dalbergia sissoo</i> Roxb.	Papilionaceae	Wild throughout the province	—	S M	R R
11. <i>Diospyros perigyna</i> Gurk.	Ebenaceae	Wild throughout the province	Medicinal	S	R
12. <i>Elaeodendron roxburghii</i> Wt. & Arn.	Celastraceae	Wild in North Bengal	Ornamental	S	R
13. <i>Erythrina parviflora</i> (Decne.) Meizer Dress	Apocynaceae	Planted in gardens	—	M	R
14. <i>Ficus bengalensis</i> L.	Moraceae	Wild throughout the province	Religious plant	S	R

TABLE 1 (Contd.)

Name of the Hosts	Family	Distribution of Hosts	Economic Importance	Type of Infection	Type of Host
15. <i>Ficus hispida</i> L.F.	Moraceae	Wild throughout the province	Fruit edible	S	R
16. <i>Ficus lacore</i> (Bush) Ham.	"	"	"	S	R
17. <i>Ficus religiosa</i> L.	Bignoniaceae	Planted as avenue tree in drier districts	Religious plant	S	C
18. <i>Kigelia pinnata</i> DC.	Sapotaceae	Planted in Parmadan forest, 24-Parganas	Avenue tree	S	R
19. <i>Labrania bojeri</i> A.DC.	Anacardiaceae	Wild throughout the province	Avenue tree	S	R
20. <i>Lannea coromandelica</i> (Houtt.) Merr.	"	Planted in gardens	—	S	R
21. <i>Mangifera indica</i> L.	Sapotaceae	Wild or planted as avenue tree	Fruits and wood	P	C
22. <i>Mimusops elengi</i> L.	Moraceae	Cultivated in drier districts	Ornamental tree	S	R
23. <i>Morus alba</i> L.	Euphorbiaceae	Wild in 24-Parganas	—	S	R
24. <i>Sapium sebiferum</i> Roxb.	Myrtaceae	Cultivated as avenue tree	—	M	C
25. <i>Syzygium jambos</i> (L.) Alston.	Meliaceae	Planted as avenue tree	Fruits	S	R
26. <i>Swietenia mahagoni</i> (L.) Jacq.	Combretaceae	"	"	S	R
27. <i>Terminalia catappa</i> L.				S	R

P = Profuse infection

M = Moderate infection

S = Slight infection

C = Common host

R = Rare host

noted that the intensity of the infection to different host species as well as their distribution in certain regions are variable. The cause for the varied range of pathogeneity and their irregular distribution may be due to local climatic effect on parasitism. It has been observed that the humid zone is rich in parasites whereas dry zone has less parasities. Similarly the industrial belt exhibits reduction of parasitic activity perhaps due to the gases and fumes covering the area. These effects may have bearings on the physiological processes of the germinating seeds on the host species and thereby control the parasitic activity. It has been also recorded that gymnosperms or monocotyledon taxon do not have this parasitic infection.

The observations are summarised in Table 1.

### 31. NOTES ON SOME INTERESTING CYPERACEAE OF GUJARAT

During the course of a critical study of the Cyperaceae of Gujarat, we came across a few cyperaceous plants which are either little known or unrecorded for Gujarat. Where the plant was recorded by Cooke (Fl. Pres. Bombay Vol. III. 1958), the name adopted by him is given in parenthesis.

#### **Cyperus polystachyos** Rottb.

(*Cyperus odoratus* Linn.)

This plant is listed by Cooke (p. 372) from Gujarat on the authority of Woodrow who collected it from Surat. Blatter (*Journ. Bombay nat. Hist Soc.* 19:162. 1909) has also reported it from Kutch. It is included by Sabnis (*Bull. bot. Surv. India* 4:195. 1962) in his Cyperaceae of Gujarat.

Since the reports of Cooke and Blatter, it has not been reported to occur in Gujarat. One specimen (*G.L. Shah* 10477) from Baroda, kept in the Blatter Herbarium, Bombay as an unidentified *Cyperus*, collected in December 1954, is of this species. The present report thus confirms its occurrence in Gujarat but this herbarium specimen consists of two distinct taxa, which, following Kukenthal (Pfreich. 101:367-370. n. 328. 1936), are varieties *polystachyos* and *laxiflorus*.
